

React JS vs React Native

- React-Native is a framework, where ReactJS is a javascript library you can use for your website.
- ReactJS is a JavaScript library, supporting both front-end web and being run on a server, for building user interfaces and web applications.
- React Native is a mobile framework that compiles to native app components, allowing you to build native mobile applications for different platforms (iOS, Android, and Windows Mobile) in JavaScript that allows you to use ReactJS to build your components, and implements ReactJS under the hood.
- React-Native doesn't use HTML to render the app, but provides alternative components that work in a similar way. Those React-Native components map the actual real native iOS or Android UI components that get rendered on the app.
- React-Native is not made from web elements and can't be styled in the same way.
